Title: Turning Interview Data into Design Principles

Description:

We grouped the interview material into themes including difficulty entering an existing group, gradual motivation to connect, a spectrum of comfort, the role of particular spaces and common interests as a bridge. These themes led to practical principles: support smaller groups, provide a shared purpose, allow different levels of participation and help users continue a connection after the first meeting.

This synthesis moved the project away from a generic event-discovery service. The emerging opportunity was to support the fragile transition between noticing an activity and feeling able to join it. We began to frame FriendZone as a bridge from online preparation to face-to-face participation.

Visual Evidence:

Affinity mapping used to group interview findings into themes and design principles.

Statement on Learning:

I learned that synthesis is not just summarising comments. The value comes from connecting evidence to a design implication and being able to explain that connection. The affinity map made gaps visible and helped the team agree on principles that could later be tested through a prototype.
